Data Manipulation with pipes

2023-03-07

The classic way of running code

For example I want the square root of the mean of a sequence of numbers

Nested code

```
numbers <- 1:300
mean(numbers)

## [1] 150.5

sqrt(mean(numbers))</pre>
```

[1] 12.26784

Sequential code

In this case we create intermediate variables

```
numbers <- 300:546
numbers <- 1:300
numbers_mean <- mean(numbers)
sqrt(x = numbers_mean)</pre>
```

[1] 12.26784

Piping Code

It can be implemented in R using the package magrittr'. It is a dependency ofdplyr', so it is installed along.

```
library(magrittr)
```

The original symbol of the pipe is %>%. But we also have a new symbol that is similar to bash |> The purpose of pipes is to eliminate or reduce to the max the need of intermediate variables. For the mean example

```
1:300 %>% mean() %>% sqrt()
## [1] 12.26784
```

###Pipes with the surveys dataset

```
surveys <- read.csv(file = "../data raw/surveys.csv")
str(surveys)</pre>
```

```
##
  'data.frame':
                 35549 obs. of 9 variables:
   $ record_id
                  : int 1 2 3 4 5 6 7 8 9 10 ...
                        7 7 7 7 7 7 7 7 7 7 7 . . .
##
   $ month
                  : int
                        16 16 16 16 16 16 16 16 16 ...
##
   $ day
                  : int
##
                        $ year
                  : int
##
   $ plot_id
                  : int
                        2 3 2 7 3 1 2 1 1 6 ...
##
   $ species_id
                  : chr
                        "NL" "NL" "DM" "DM" ...
##
                  : chr "M" "M" "F" "M" ...
   $ sex
## $ hindfoot_length: int 32 33 37 36 35 14 NA 37 34 20 ...
##
  $ weight
                  : int NA NA NA NA NA NA NA NA NA ...
```

Calculate the mean of the year column using pipes

```
surveys$year %>% mean()
```

```
## [1] 1990.475
```

Calculate the mean of the weight column

```
surveys$weight %>% mean(na.rm=TRUE)
```

```
## [1] 42.67243
```

#Exercise 1 1. Load surveys.csv into R using read.csv(). 2. Use select() to create a new data frame object called surveys1 with just the year, month, day, and species_id columns in that order. 3.Create a new data frame called surveys2 with the year, species_id, and weight in kilograms of each individual, with no null weights. Use mutate(), select(), and filter() with !is.na(). The weight in the table is given in grams so you will need to create a new column called "weight_kg" for weight in kilograms by dividing the weight column by 1000. 4. Use the filter() function to get all of the rows in the data frame surveys2 for the species ID "SH".

1.

```
surveys <- read.csv(file = "../data raw/surveys.csv")</pre>
```

2.

```
surveys1 <- select(surveys, year, month, day, species_id)
str(surveys1)</pre>
```

```
## 'data.frame': 35549 obs. of 4 variables:
## $ month
           : int 7777777777...
## $ day : int 16 16 16 16 16 16 16 16 16 ...
## $ species_id: chr "NL" "NL" "DM" "DM" ...
 3.
surveys2 <- select(surveys, year, species_id, weight)</pre>
str(surveys2)
## 'data.frame': 35549 obs. of 3 variables:
## $ species_id: chr "NL" "NL" "DM" "DM" ...
## $ weight : int NA ...
surveys2 <- mutate(surveys2, weight_kg = weight/1000)</pre>
str(surveys2)
## 'data.frame':
              35549 obs. of 4 variables:
## $ species_id: chr "NL" "NL" "DM" "DM" ...
## $ weight : int NA ...
## $ weight_kg : num NA ...
surveys2 <- filter(surveys2,!is.na(weight_kg))</pre>
surveys2 <- select(surveys2, year, species_id, weight_kg)</pre>
colnames(surveys2)
## [1] "year"
                "species_id" "weight_kg"
#surveys2[ , c(1,3)]
#surveys2 { , c("year, "weight_kg")}
str(surveys2)
## 'data.frame':
               32283 obs. of 3 variables:
## $ species_id: chr "DM" "DM" "DM" "DM" ...
